

## **Economic Geography**

Economic Geography (traditionally) focuses on the relationships in space and specifically between places with the production, distribution and consumption of goods and services. Despite the fact that it maintains a dominant relationship with the economic one, the relationship is not exclusive and therefore it also studies non-economic factors in the attempt to analyze the relations in the field. The course of Economic Geography will focus on the following:

- In concepts related to space.
- In the spatial nature of productive activities
- Location theories in the primary sector
- Location theories in the secondary sector
- Tertiary sector location theories.
- The Population
- Natural Resources - energy - ecology
- Urbanization - Network of settlements
- Organization of urban space.
