

Investments Evaluation and Feasibility Studies

This course examines the concepts of discounting cash flows, present and future values, funding sources, and investment evaluation methods. Feasibility studies play an important role, while some aspects of their implementation are given by companies' practical examples. In this context, the process of preparing an economic-technical study, the appropriate risk management, and the steps to be followed for a desired operational result are analyzed in detail. The role of the financial and technical analyst in this whole process is crucial. The presentations are enriched with laboratory exercises and Case Studies on investment incentives laws and subsidized NSRF programs.
